

debates, bringing together 230 speakers, more than 2,000 in-person participants and 10,000 online. The House of Insurance established itself as a platform for content and cross-sector engagement, with the participation of government authorities, business leaders, policymakers, climate experts, scientists and members of academia from Brazil and abroad.

In this environment, it became even clearer that the role of insurance is undergoing a profound transformation. Traditionally focused on post-disaster compensation, the sector is increasingly being called upon to anticipate, measure and mitigate risks.

In response to this shift, CNseg launched, during COP, the first phase of its Climate Intelligence Hub, which integrates data, analytics and tools to support the incorporation of climate variables directly into insurers' decision-making processes. It is a solution aligned with this moment of transition, as the market moves from a reactive model to one of anticipatory resilience.

However, isolated efforts will not be sufficient. Climate risk is global, and the response to the challenges we face must be collaborative and coordinated. The recognition of the role of insurance in the COP30 official documents clearly signaled a meaningful shift: the sector has moved to a central position in the climate agenda. But recognition alone is not enough. The experience of the House of Insurance in Belém reinforced the urgency of joint and structured action.

We must recognize that addressing the impacts of climate change requires cooperation and risk-sharing at a global scale. This is a capability that only the insurance industry can provide. Exclusively local solutions will be more costly and less efficient, and may ultimately lead to a widening of protection gaps.

From this perspective, CNseg envisions the creation of the Global Insurance Task Force on Climate Change, an initiative we believe could be launched at COP31. It represents a call for the insurance sector to act in a coordinated manner, overcoming fragmentation and accelerating the development of innovative solutions.

In this regard, the Rendez-Vous de Casablanca de l'Assurance 2026 offers an important setting for the first international presentation of this proposal, positioning this moment as part of the Brazilian insurance sector's broader trajectory toward the next Conference of the Parties, to be held in Turkey.

We are at a decisive moment, in which the ability to align markets will be constantly tested. Too often, we remain overly focused on domestic agendas, failing to recognize that the risks we face are, in essence, shared.

In light of this scenario, the Brazilian insurance market is issuing a clear call for action and coordination, bringing together different actors across the sector around concrete solutions to strengthen climate resilience.

The Global Insurance Task Force on Climate Change is an invitation to transformation. In a reality increasingly shaped by climate volatility, the sector must move beyond responding to risk and begin to actively shape the resilience agenda. The ability to anticipate and manage risks will be a defining asset for sustainable development.
